

Using useState hook in React

like and share

[varName, methodName]

Declare useState hook with variable name "**count**", method name "**setCount**" and initial value of "**0**"

```
const App = () => {  
  const [count, setCount] = useState(0);  
  
  return(  
    <>  
      {count}  
    </>  
  )  
}
```

useState returns an array with **two** values. **first** one is stateful value, and the **second** one is the method to update it.

First value is same as the value passed as the **argument**.

```
const [count, setCount] = useState(0);
```

Swipe →

Now we can use the "**setCount**" method to update our "**count**" variable on every click.

```
<>
  {count}
  <div className="button-wrap">
    <button onClick={() => setCount(count + 1)}>Click me</button>
  </div>
</>
```

update like this!

Do you find it helpful?

let me know down in the
comments !
